A headspace sampler is a GC autosampler accessory for introducing volatiles that are contained in liquid or solid samples into a gas chromatography. The analytical technique is called "static headspace gas chromatography." The term "headspace" refers to the space above or the liquid sample that you place in a sealed vial. The term "static" means that the volatiles in the headspace of the vial are at equilibrium with the same compounds in the liquid or solid sample.

The instrument extracts a reproducible volume of the headspace and injects it into the carrier gas flowing into the gas chromatograph. Food, packaging, pharmaceutical products, soil, and water are often tested to see if they meet quality criteria or regulatory standards. products are analyzed using headspace in order to understand their composition. Forensics laboratories use headspace for measuring the percent of ethanol in human blood to see if a driver is legally intoxicated.
