The global Heat Pipe for Electronic Device market size is predicted to grow from US\$ 1386 million in 2025 to US\$ 1852 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

In 2025, global Heat Pipe for Electronic Device production reached approximately 257,700 k units with an average global market price of around US\$ 5.5 per unit, and a gross profit margin of approximately 10%-30%. Heat Pipes for electronic devices are passive two-phase heat transfer components that move heat rapidly from hotspots to heat sinks using evaporation and condensation of a working fluid inside a sealed tube. A porous wick structure returns the condensed liquid by capillary action, enabling high effective thermal conductivity with low power. Heat pipes are widely used in laptops, smartphones, servers, power electronics, telecom equipment, and automotive electronics to reduce junction temperature, improve reliability, and support thinner, higher-performance thermal designs under varying orientations and loads. The industrial chain of Heat Pipes for electronic devices includes upstream copper or aluminum tubes, wick materials, working fluids, sintering or grooving equipment, vacuum charging systems, brazing consumables, thermal interface materials, and testing instruments. The midstream focuses on tube forming, wick preparation, vacuum evacuation and filling, sealing, bending and flattening, surface treatment, thermal performance testing, and quality inspection. Downstream applications include consumer electronics, servers and data centers, communications hardware, industrial control, and automotive electronics, along with thermal module assembly combining heat pipes with vapor chambers, heat sinks, fans, and housings. Services include design support, reliability validation, and lifecycle supply assurance.
