A heat pipe loop system is a heat transfer system that usually consists of one or more heat pipes that form a closed loop or cycle. In a heat pipe loop system, one part of the heat pipe (usually the evaporator) receives heat, causing the working fluid in it to evaporate into a gas, which then flows through the pipe to another part (usually the condenser), where it releases the heat and condenses again. As liquid, it eventually returns to the evaporator part, forming a closed thermal cycle. Heat pipe loop systems are typically designed to transport and dissipate heat for thermal management and heat dissipation purposes. They are commonly used in areas that require efficient heat transfer and temperature control, such as electronic equipment, aerospace, automotive industry, etc. Heat pipe loop systems are simple, reliable and efficient and suitable for a variety of environments and working conditions.

The global Heat Pipe Loop System market size is projected to grow from US\$ 461 million in 2024 to US\$ 667 million in 2030; it is expected to grow at a CAGR of 6.4% from 2024 to 2030.
