Heat sealable films are specialty multi-layered shrink films that are used for packaging products which require higher heat levels than traditional flexible films. These films are made with an exterior coating that inhibits the core of the film from melting. This prevents damage to the film during the heating process. Generally speaking, the core is either polypropylene or polyethylene.

Additionally, there is a layer of sealant inside the film. This sealant features a lower melting point than the rest of the film and allows the seal to stay intact. This results in a tightly sealed final product.

The global Heat Sealable Composite Films market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
