The global Heat Shielding Sheet market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Heat shielding sheets are made by processing chemical materials and are heat-resistant materials with excellent noncombustibility properties that prevent the temperature of objects and spaces from rising by inhibiting heat transfer. Materials include metal, glass, silica, rubber, and plastic.

Heat shielding sheets undergo a heat-induced change of state depending on the sheet material. Polypropylene (PP), for example, is a solid and easily deformable sheet in the low temperature range. However, when the temperature range reaches medium, it begins to deform, becoming rubbery, intermediate between a solid and liquid state, and showing elasticity. Under high temperatures, it melts and becomes a sludgy liquid state and begins to flow. In general, heat-resistant sheets undergo a state change when exposed to heat, losing their functionality as described above.

United States market for Heat Shielding Sheet is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Heat Shielding Sheet is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
