The global Heat Stabilizers for PVC Plastisol market size is predicted to grow from US\$ 2363 million in 2025 to US\$ 2993 million in 2031; it is expected to grow at a CAGR of 4.0% from 2025 to 2031.

Polyvinyl chloride (PVC) is one of the most important commercial plastic but, it is thermally unstable at processing temperatures. Therefore, heat stabilizers are widely used to safeguard vinyl products at all stages by improving resistance of PVC products at high temperature.

Heat stabilizers are essential additives in PVC formulations, especially plastisols, as they prevent thermal degradation of the polymer during processing and use. Increasing environmental concerns and regulations regarding toxic heavy metal content in PVC formulations have led to a shift towards more eco-friendly and sustainable heat stabilizers. Calcium-based and organotin-free stabilizers gained prominence as alternatives to traditional heavy metal stabilizers. Concerns about phthalate plasticizers in PVC led to the development of phthalate-free plastisols. Heat stabilizers compatible with phthalate-free formulations were in demand.
