The global Heat Transfer Pump market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A heat transfer pump is a type of mechanical pump that is used to transfer heat from one place to another. It is typically used in heating and cooling systems, where it can move thermal energy from one location to another. Heat transfer pumps utilize a refrigerant, which serves as the medium for transferring heat. When the refrigerant absorbs heat, it vaporizes and moves to the condenser, where it releases the heat and condenses back into a liquid. The liquid is then sent back to the evaporator to start the cycle again. Heat transfer pumps are commonly found in HVAC systems and refrigeration units.
