Heat treatment equipment, also known as furnace tube equipment, is used for heat treatment processes in semiconductor front-end processes, including oxidation furnaces, diffusion furnaces, annealing furnaces and rapid annealing furnaces, etc., which are used in oxidation, diffusion and annealing processes respectively. According to the equipment form, it can be divided into three categories: horizontal furnace, vertical furnace and rapid heat treatment furnace. The difference between horizontal furnaces and vertical furnaces lies in the shape of the reaction chamber. Because vertical furnaces have the advantages of small footprint, low cost, batch heat treatment, and high controllability, they are currently the most widely used. However, both horizontal furnaces and vertical furnaces heat up and cool down the cavity together with the silicon wafers placed in it, so the temperature rise and fall rate is slow, but 100 to 200 wafers can be placed at one time, while the Rapid Thermal Processing Furnace (RTP) only Changing the temperature of the wafer inside does not change the cavity temperature, so rapid annealing can be performed, but only a single wafer can be processed.

The global Heat Treatment Furnace Tube Equipment market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
