The global Heated NOx Analyzer market size is predicted to grow from US$ 487 million in 2025 to US$ 1382 million in 2031; it is expected to grow at a CAGR of 19.0% from 2025 to 2031.

The heated nitrogen oxide analyzer is an instrument specially used to measure the concentration of nitrogen oxides (NOx) in the environment. Its core principle is based on the chemiluminescence detection technology. It converts nitrogen dioxide (NO2) into nitric oxide (NO) by heating the conversion chamber, and then uses NO to react with ozone (O3) to produce chemiluminescence. The concentration of NO is determined by measuring the luminescence intensity, and then the concentration of NOx is calculated.

As the world pays more and more attention to environmental protection and air quality, the market demand for nitrogen oxide monitors continues to increase, and the market size continues to grow. The market size and development speed vary in different regions. For example, the market size in developed regions such as North America and Europe is large and growing steadily; while emerging markets such as Asia and South America have great growth potential.
