Wood chippers and shredders are powerful outdoor equipment designed to process wood, branches, and other yard waste into smaller, more manageable pieces. While they serve similar purposes, there are slight differences between the two: Wood chippers are primarily used for reducing larger pieces of wood and branches into small chips or chunks. They are ideal for processing thicker branches and tree limbs, turning them into uniform wood chips that can be used for mulch, landscaping, or composting. Wood chippers are typically more heavy-duty and powerful compared to shredders. Shredders, on the other hand, are designed to handle a wider variety of materials, including softer garden waste such as leaves, twigs, and smaller branches. Shredders produce finer shredded material suitable for composting, mulching, or disposal. They are often more versatile and can handle a broader range of organic waste materials.
