The global Heavy Metal Detoxification Drug market size is predicted to grow from US$ 99 million in 2025 to US$ 177 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

Heavy metal detoxification drugs are those that can specifically complex, chelate, or displace heavy metal ions (such as lead, mercury, cadmium, arsenic, and copper) at accumulated or toxic levels in the body, forming soluble, low-toxicity, or easily excreted complexes that are then eliminated from the body via the kidneys or bile. These drugs reduce the concentration of heavy metals in the blood, tissues, or organs through chemical binding, mitigating damage to the nervous system, liver and kidney function, and hematopoietic system, and promoting the recovery of metabolic function. Common heavy metal detoxification drugs include British anti-Lewisite (BAL), calcium sodium ethylenediaminetetraacetate (CaNa?EDTA), sodium dimercaptopropanesulfonate (DMPS), and dimercaptosuccinic acid (DMSA), which are selected clinically based on different types of metal poisoning, exposure doses, and individual differences. The research and application of these drugs involves interdisciplinary research in pharmacology, toxicology, and clinical medicine, and are of great significance for industrial and environmental pollution control, occupational protection, and emergency medical care.

The heavy metal detoxification drug industry chain covers a complete system from upstream chemical raw material preparation to downstream clinical application and environmental remediation. Upstream mainly includes the production of basic chemical and pharmaceutical intermediates such as organosulfur compounds, amino acid derivatives, chelating agent precursors, and metal ion capturing ligands. The purity of raw materials and reaction control directly determine the safety and stability of the drug.

Midstream involves the synthesis, formulation development, and industrial production of core drugs, including chelation mechanism research, pharmacokinetic optimization, dosage form innovation (such as injections, oral tablets, and sustained-release formulations), and GMP-standardized manufacturing systems. Downstream encompasses applications in hospitals, emergency centers, occupational disease prevention and control institutions, and environmental heavy metal pollution remediation, primarily for medical detoxification of lead, mercury, arsenic, and cadmium poisoning and intervention treatment for chronically exposed populations. Furthermore, with the increasing risks of industrial pollution and occupational exposure, heavy metal detoxification drugs are also developing synergistically with environmental monitoring, bioremediation, personalized medicine, and toxicological testing, forming a comprehensive industry chain integrating scientific research innovation, drug production, and public health protection.

In 2024, the global production of heavy metal detoxification drugs reached 6.64 million units, with an average selling price of US$14 per unit. The gross profit margin for heavy metal detoxification drugs was 52%, and the annual production capacity of a single production line for heavy metal detoxification drugs was 200,000 units.

United States market for Heavy Metal Detoxification Drug is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Heavy Metal Detoxification Drug is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
