A height limiter is a safety control device used to monitor and restrict the vertical movement height of equipment or components. When the controlled object reaches a preset height threshold, it automatically triggers an alarm or stops operation to prevent structural damage or safety hazards caused by over-height movement. It typically employs mechanical triggering mechanisms, limit switches, or electronic sensors for position detection and control, and is widely used in lifting equipment, elevating platforms, and automation systems.

Upstream includes structural materials such as steel and engineering plastics, limit switches or position sensors, control circuits, and connection components. Downstream applications include lifting machinery, elevating equipment, and industrial automation systems. The overall industry gross margin generally ranges from 20% to 40%, with higher margins for intelligent electronic models.

The global production of height limitators is projected to reach 2.1 million units by 2025, with an average price of \$120 per unit.
