The Helicobacter pylori breath test, also known as the urea breath test (UBT), is a non-invasive diagnostic procedure used to detect the presence of H. pylori bacteria in the stomach and upper gastrointestinal tract. The test relies on the ability of H. pylori to metabolize urea, a naturally occurring substance. During the test, the patient ingests a small amount of urea labeled with a non-radioactive or radioactive tracer. If H. pylori is present, it will break down the urea into carbon dioxide and ammonia. The carbon dioxide is then absorbed into the bloodstream and exhaled through the lungs. The patient breathes into a collection device, and the exhaled breath is analyzed for the presence of the tracer, indicating the presence of H. pylori infection. The UBT is considered highly accurate and is preferred over invasive procedures like endoscopy for diagnosing H. pylori infection.

The global Helicobacter Pylori Breath Test market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
