The global Helicopter Flotation System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

A Helicopter Flotation System is a safety device installed in helicopters to provide buoyancy and prevent the aircraft from sinking in the event of a water landing or ditching. It consists of inflatable floats or pontoons that are deployed when the helicopter comes into contact with water.

The flotation system is typically located on the sides or bottom of the helicopter and is activated either manually or automatically upon contact with water. Once deployed, the floats provide additional buoyancy to keep the helicopter afloat and prevent it from sinking.

The flotation system is designed to keep the helicopter stable and upright in the water, allowing occupants to safely evacuate the aircraft. It also helps to protect the helicopter from damage caused by water immersion.

Helicopter flotation systems are an important safety feature, especially for helicopters operating over water or in offshore environments. They provide an added layer of protection and increase the chances of survival for occupants in the event of a water landing or emergency.
