A helium hard drive is a hard drive that is filled with helium gas instead of air. Helium is less dense than air, thus reducing air resistance as the platter spins. This technology allows for higher density stacking of platters inside the hard drive, thereby increasing storage capacity while reducing energy consumption and heat generation. By using helium filling technology, hard drive manufacturers can fit more platters into the same size drive, thereby increasing storage density. This is particularly attractive for areas such as data centers and cloud computing that require high-capacity storage solutions. Helium hard drives have become widely adopted in these applications and are generally considered to have higher reliability and performance than traditional air hard drives.

The global Helium Hard Drive market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
