Heme iron polypeptide HIP, also known as heme iron, is iron bound to porphyrin in hemoglobin and myoglobin. This form of iron is highly biologically active in the body and can be directly absorbed by intestinal mucosal epithelial cells in the form of porphyrin iron. Therefore, its absorption rate is usually high and is generally not affected by inhibitory factors such as phytate or promoting factors such as VC. Heme iron is mainly found in animal red meat, liver and blood, and is the main form of iron in these foods.

Heme iron is a dark substance with specific chemical properties that enable it to remain stable in various environments and conditions.
