Hemocompatible Coating is a technology used for surface modification of medical devices, which meets the requirements of medical specifications and has good biocompatibility. In the dry state, the coating thickness is within 5 microns and has good toughness. It adheres evenly on the surface of medical devices, is colorless and transparent, and is difficult to observe with the naked eye. In the wet state, the coating is activated by water to form a colorless and transparent hydrogel, which is highly lubricious and can withstand repeated friction, and has a wide range of applications in the medical field.

United States market for Hemocompatible Coating is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
