Blood clotting or coagulation, is an important process that eliminates excessive bleeding when a blood vessel is damaged. Platelets and proteins work together to stop the bleeding by forming a clot over the injury. Blood clottage is one of the mechanisms that reduce the loss of blood from damaged blood vessels. Hemostats and tissue sealants are used post-surgery or traumatic injury to bind or hold external tissue (skin) as well as internal tissue (blood vessels). Some key types of hemostats and tissue sealants include fibrin sealants, collagen-based compounds, synthetic agents, and tissue adhesive glues such as hydrogels and glutaraldehyde glues. Fibrin sealants have a wide range of medical applications.

According to our research, the global market for medical devices is estimated at US$
