Heparan sulfate is a highly sulphated polysaccharide, synthesized as the glycosaminoglycan component of heparan sulfate proteoglycans (HSPGs). It is widely distributed on the cell surfaces and basement membranes in mammals. It is involved in important biological processes due to it displaying specific interactions with many biologically active proteins. This includes examining of the dynamic distribution of HSPG in tissues and analysing HS structures for the elucidation of HSPG biological functions.

Using any of the heparan sulfate antibodies, subtle differences in HS patterns can be identified and can be used in applications such as flow cytometry, allowing direct comparison of multiple cell types.
