Hepatitis D, also known as delta hepatitis, is a liver infection caused by the Hepatitis D virus (HDV). It is considered a satellite virus, as it requires the presence of the Hepatitis B virus (HBV) to replicate and cause infection. HDV infects individuals either as a co-infection with HBV or as a superinfection in those already infected with HBV. Hepatitis D is caused by the HDV, which can only infect individuals already infected with HBV. HDV can spread through contact with infected blood or body fluids, similar to HBV transmission routes. Injection drug use, exposure to infected blood, or unprotected sexual contact with an HBV/HDV-infected person are common risk factors for acquiring Hepatitis D.

The global Hepatitis Delta Virus (HDV) Infection market size is projected to grow from US\$ 1585 million in 2024 to US\$ 8063 million in 2030; it is expected to grow at a CAGR of 31.1% from 2024 to 2030.
