The parameter server is a cloud server architecture used to manage and share model parameters in deep learning. It stores model parameters on a central server and shares them through the network to various computing nodes participating in training. Heterogeneous parameter server is a high-performance deep learning cloud server architecture that mixes multiple computing units. It mixes different types of computing hardware (such as CPU, GPU, and various dedicated accelerators, etc.), and usually sets up two training nodes and server nodes. Class nodes to calculate, update and distribute parameters to improve the efficiency and performance of model training.
