The global Hetrombopag Ethanolamine market size is predicted to grow from US\$ 238 million in 2025 to US\$ 616 million in 2032; it is expected to grow at a CAGR of 11.3% from 2026 to 2032.

In 2025, global Herombopag Ethanolamine production reached approximately 165,000 units. Hetrombopag Ethanolamine is an orally administered small-molecule thrombopoietin receptor agonist (TPO-RA), primarily used for the treatment of thrombocytopenia-related disorders. It is the ethanolamine salt form of hetrombopag and works by selectively activating the thrombopoietin receptor (c-Mpl), thereby promoting the proliferation and differentiation of megakaryocytes and increasing platelet production. Clinically, the drug is mainly used for the treatment of conditions such as primary immune thrombocytopenia (ITP), effectively improving platelet counts and reducing the risk of bleeding. Compared with traditional therapies, hetrombopag ethanolamine offers advantages including convenient oral administration, stable efficacy, and a favorable safety profile. As one of the innovative drugs independently developed in China, it demonstrates promising application prospects in the treatment of hematological diseases.

Hetrombopag Ethanolamine, as an orally administered thrombopoietin receptor agonist (TPO-RA) independently developed in China, is primarily positioned in the treatment market for thrombocytopenia, particularly addressing clear clinical needs in indications such as primary immune thrombocytopenia (ITP). With the acceleration of population aging, the rising incidence of thrombocytopenia associated with cancer therapies, and increasing attention to bleeding risk management, the global thrombocytopenia treatment market continues to expand, providing stable growth opportunities for this drug. From a competitive perspective, existing therapies such as eltrombopag and

romiplostim have already captured a certain market share; however, their relatively high cost or limitations in administration routes (e.g., injection) create opportunities for next-generation oral agents with improved safety profiles.

In the Chinese market, government support for innovative drugs, the continuous improvement of reimbursement negotiation mechanisms, and enhanced patient accessibility are expected to facilitate the market penetration of hetrombopag ethanolamine. Meanwhile, with the gradual updates of clinical guidelines and increasing physician awareness of TPO-RA therapies, its role in standardized treatment is likely to be further strengthened. From a global perspective, demand for treatments in hematological diseases continues to grow; however, expansion into international markets will still require additional clinical evidence and progress in regulatory approvals.
