The global Hexyl Aminolevulinate Hydrochloride market size is predicted to grow from US\$ 152 million in 2025 to US\$ 386 million in 2032; it is expected to grow at a CAGR of 14.5% from 2026 to 2032.

Hexyl aminolevulinate hydrochloride is a hexyl ester-modified derivative of aminolevulinic acid and belongs to photodynamic therapeutic agents. It can be selectively taken up by abnormally proliferating cells and converted into protoporphyrin IX, a photosensitive substance. Under illumination with a specific wavelength, it generates singlet oxygen, thereby inducing apoptosis and necrosis of lesion cells to achieve precise targeted therapy.

This drug exhibits excellent tissue permeability and lesion selectivity. It is mainly used for photodynamic therapy of diseases such as fluorescence diagnosis of bladder cancer and high-grade cervical intraepithelial neoplasia. Compared with traditional drugs, it has superior advantages in local permeability, therapeutic accuracy and safety, making it an important agent in the field of minimally invasive diagnosis and treatment of genitourinary and gynecologic tumors. In 2025, global Hexyl aminolevulinate hydrochloride production reached approximately 120,000 bottles.

Hexyl aminolevulinate hydrochloride, a hexyl ester derivative of 5-aminolevulinic acid, is an important product in the field of photodynamic therapy and precision diagnosis and treatment. Its core advantages lie in strong tissue permeability and high lesion targeting. It can be converted into protoporphyrin IX in abnormally proliferating cells and generate singlet oxygen upon activation by specific light irradiation, achieving the dual functions of targeted cell killing and fluorescence imaging. Globally, the drug has been approved for the fluorescence diagnosis and treatment of bladder cancer, forming a mature

clinical application pathway. The Chinese market has recently achieved a key breakthrough, with the corresponding ointment preparation approved for high-grade cervical intraepithelial neoplasia, filling the gap in minimally invasive non-surgical gynecological treatment. In terms of market structure, overseas enterprises dominate the early global layout, while domestic companies are gradually establishing a localized supply and diagnosis-treatment system through commercial preparation and clinical research. Overall, the field is expanding rapidly around minimally invasive treatment needs in urological and gynecological tumors, with a technical focus on drug-device combination and precise targeting. Future growth potential lies in indication expansion and standardized promotion of diagnosis and treatment, making it a key carrier for the extension of photodynamic therapy from diagnosis to the full treatment process.
