Abstracts

The global HF & UHF RFID Tags market size is predicted to grow from US$ 1680 million in 2025 to US$ 3983 million in 2032; it is expected to grow at a CAGR of 13.4% from 2026 to 2032.

In 2024, the global production of HF & UHF RFID Tags will reach 48.279 billion pieces, with an average selling price of US$0.0315 per piece. An RFID system primarily consists of three components: a tag: a small chip attached to an object that stores the object's identification information; a reader: which transmits radio frequency signals to wake the tag and read its information; and a computer system: which receives the information transmitted by the reader and performs subsequent processing and application. The RFID tag is the core component of the system, responsible for storing and transmitting the object's identification information. It uses radio waves to identify the target and transmit data without mechanical or optical contact. An RFID tag primarily consists of a chip and an antenna. The chip stores the object's identification information, such as the product number, production date, and manufacturer. The antenna receives and transmits radio waves. RFID is categorized into four frequency bands based on the frequency used: low frequency, high frequency, ultra-high frequency, and microwave. Different frequency bands differ in their operating principles, resulting in differences in coupling methods, read distances, data storage capacity, and application areas. High frequency and ultra-high frequency tags are currently the mainstream in the market, offering high commercial value and are the focus of RFID tag manufacturers.

In the RFID-related industry, the upstream sector primarily comprises suppliers of raw materials such as chips, antennas, conductive adhesives, and paper. The midstream sector includes RFID product R&D and manufacturing, as well as reader and system application manufacturers. The downstream sector encompasses various application sectors such as retail, public life, industrial manufacturing, and healthcare. Upstream chip suppliers include Impinj and NXP, while production equipment suppliers for die

bonding and laminating machines include Muehlbauer. Downstream companies include consumer companies like Uniqlo, Decathlon, Jiangsu Yanghe Brewery Joint-Stock Co., Ltd., ZARA, H&M, and HLA Group; retailers like Walmart, Marks & Spencer, Target, and 7-11 X-Store; and FedEx, China Eastern Airlines, and SGCC.

Drivers:

The retail industry's product production, distribution, warehousing, and sales processes have traditionally relied heavily on barcodes, consuming significant labor and time for inventory. RFID technology addresses this pain point, enabling businesses to quickly and accurately track current inventory levels at the point of sale. Through precise production technology innovation, RFID costs can be reduced to a level that allows for large-scale adoption. Currently, the primary markets for RFID tags are in Europe, the United States, and Japan, primarily in the apparel and retail industries. With the development of e-commerce, fast fashion, and new retail, the demand for RFID tags for real-time inventory information will become even more urgent.

Trend:

RFID application areas continue to expand: With the rapid development of technologies such as big data, cloud computing, the Internet of Things (IoT), and 5G, various industries are rapidly embracing digital transformation to improve operational efficiency and competitiveness. In the apparel industry, RFID applications are relatively mature, with steadily increasing penetration rates. Multinational brands have demonstrated the benefits of optimizing supply chain management and streamlining checkout processes. In the retail industry, major European and American retailers have been steadily promoting the adoption of RFID technology in recent years, gradually requiring suppliers to use RFID tags to strengthen supply chain management and adjust sales strategies based on customer satisfaction data. As RFID technology continues to mature and its costs decrease, its application has expanded to areas such as logistics and food, becoming a key driver of digital transformation and upgrading. Increased Customization of Electronic Tags: As the application areas of RFID tags continue to expand, downstream industries are increasingly demanding customized products. Manufacturers must develop customized products tailored to the needs of individual customers and their respective application scenarios. Therefore, RFID tags tailored to specific industries or application environments, such as fabric tags, fragile tags, anti-counterfeiting tags, and anti-metal tags, will become a new development trend. Ultra-high frequency (UHF) tags offer low costs and wide applications: UHF RFID tags have a read range of over 10 meters and are primarily used in retail, warehouse management,

logistics tracking, automated control, and anti-theft. UHF RFID tags offer advantages such as fast data transmission, long range, large information storage capacity, and mass readability, offering a broad range of applications. With continued technological advancement and decreasing costs, they will find wider application in more areas.
