## Abstracts

The global Hierarchical Porous Carbon market size is predicted to grow from US\$ 1990 million in 2025 to US\$ 4711 million in 2032; it is expected to grow at a CAGR of 13.2% from 2026 to 2032.

Hierarchical Porous Carbon (HPC) is a class of advanced carbon materials engineered with a multi-scale pore structure—typically integrating micropores (50 nm)—within a single framework to optimize surface area, mass transport, and electrochemical performance. It is widely used in applications such as lithium/sodium-ion battery anodes, supercapacitors, catalysis, adsorption, and gas storage due to its high conductivity, tunable porosity, and structural stability. The supply chain begins upstream with carbon-rich precursors such as biomass (e.g., lignin, cellulose, coconut shells), synthetic polymers (e.g., phenolic resins, polyacrylonitrile), or petroleum pitch, along with activating agents like KOH, ZnCl<sub>2</sub>, or CO<sub>2</sub>. Midstream processing involves carbonization (typically 600–1200°C), chemical or physical activation to create hierarchical pores, templating (hard/soft templates like silica or block copolymers), and post-treatments such as doping (N, O, S) or surface functionalization. Downstream, HPC materials are integrated into electrodes, catalyst supports, filtration systems, and energy storage devices, with key end users spanning EV batteries, grid storage, water purification, and chemical processing industries. In 2025, global Hierarchical Porous Carbon output was about 900,000 tons with 1.3 million tons of capacity, average prices of USD 2,100 – 3,800 per ton, and gross margins around 33%.
