The global High Density Interconnector Board market size is predicted to grow from US$ 13430 million in 2025 to US$ 19870 million in 2031; it is expected to grow at a CAGR of 6.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The full name of HDI circuit board is high-density interconnect printed circuit board (HDI). This means that the PCB has smaller traces and holes, and can accommodate more components in the same space. The traces connecting components and integrated circuits (ICs) are very thin and carry low current. High-density interconnect technology mainly uses micro-blind buried hole technology to make a printed circuit board with a higher line density distribution. The biggest difference between it and traditional printed circuit boards is the way of hole formation. High-density interconnect technology uses non-mechanical drilling method, and laser hole formation is the mainstream. In addition, high-density interconnect boards are manufactured using the layer-building method. The more layers are added, the higher the technical capabilities required. In addition, advanced printed circuit board technologies such as electroplating hole filling, stacking holes, and laser direct drilling are required during production. High-density interconnect boards have the advantages of being light, thin, short, high line density, better electrical characteristics and signals, short transmission paths, and improved radio frequency interference/electromagnetic interference/electrostatic discharge. Any-layer HDI is an advanced high-density connection technology. All layers are connected by laser drilling, which can make the product thinner and lighter, but it is also more difficult. The product is widely used in smartphones, tablets, wearable

devices, optoelectronic panels, automotive panels, storage devices, etc.; with the high frequency and high speed of various communication needs, the application of this technology will be more extensive.

Regional distribution:

Asia-dominated: China, Taiwan, South Korea, and Japan account for more than 70% in total.

China's market share: about 40% of the world, the largest producer and consumer.

Application area share:

Smartphones (40%), PC/tablets (20%), automotive electronics (15%), communication equipment (15%).

Global HDI market growth rate:

CAGR is expected to be 5.5-7.0% from 2025 to 2030 (higher than the growth rate of ordinary PCB market).

Driving factors:

Consumer electronics upgrade: 5G mobile phones and folding screen devices drive high-end HDI demand.

Automotive electronics: Autonomous driving and domain controllers require high-density circuit boards.

AI and servers: High-performance computing (HPC) requires more complex HDI designs.

Growth rates in sub-sectors:

Any-order HDI (>3rd order): CAGR ~8% (driven by high-end demand).

Rigid-flex HDI: CAGR ~10% (wearable devices, flexible display drivers).
