High Density PTFE Membrane is an evolution of the ePTFE material, which has a long history of success in dentistry. The improved design eliminates node expansion, so the membrane is impervious to bacteria while still allowing the passage of gases and small molecules. It could remain exposed in the mouth protecting the underlying defect and bone graft. Although made from a non-stick material, the membrane is quickly coated with plasmatic proteins upon implantation, facilitating cellular adhesion to the membrane surface and forming a hermetic seal. It resists the bacteria and epithelial cells migration over and under the membrane. Lack of tissue ingrowth makes the removal simple and non-traumatic. It could be even removed through a small incision using a flapless technique and without the additional surgery.
