The dynamic range is used to define the light intensity range that the image sensor can detect, and it is one of the most important technical parameters of the image sensor. Due to the limited well capacity of the pixel in the image sensor, when the incident light intensity reaches a certain value, the pixel will be saturated. It is a group of techniques used to achieve a larger dynamic range of exposure (that is, a greater difference between light and dark) than ordinary digital imaging techniques. The goal of high

dynamic range imaging is to correctly represent the wide range of real-world brightness from direct sunlight to the darkest shadows. High dynamic range imaging is a group of techniques used to achieve a greater dynamic range of exposure (ie, a greater difference between light and dark) than ordinary digital imaging techniques. The goal of high dynamic range imaging is to correctly represent the wide range of real-world brightness from direct sunlight to the darkest shadows.
