High-end Double Zero Foil refers to ultra-thin, high-precision metal foil materials with extremely tight thickness tolerance and excellent surface uniformity, typically produced through advanced rolling and surface treatment processes. The term “double zero” originates from the foil thickness range, generally indicating foil below 0.01 mm (10 µm), and in high-end applications, often in the range of 4–8 µm. These foils are characterized by very low surface roughness, high purity, minimal pinholes, and strong mechanical consistency, making them suitable for demanding applications such as lithium-ion battery current collectors, high-frequency electronic components, capacitor foils, and advanced packaging materials. In 2025, global High-end Double Zero Foil production reached approximately 1113 k tons, with an average global market price of around US\$704 per ton. The production capacity for High-end Double Zero Foil in 2025 was approximately 1200 k tons. The typical gross profit margin for High-end Double Zero Foil is between 20% and 40%.
