The global High Entropy Alloy Spherical Powder market size is predicted to grow from US$ 159 million in 2025 to US$ 223 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

In 2024, global High Entropy Alloy Spherical Powder production reached approximately 458 tons?with an average global market price of around US$ 295 per kg. High Entropy Alloy Spherical Powder is an alloy powder composed of five or more primary elements (typically with atomic percentages of each element ranging from 5–35%), distinguishing it from traditional alloy systems based on a single or small number of primary elements. Due to its high mixing entropy, these alloys often form simple solid solution structures (such as FCC, BCC, and HCP) rather than complex, brittle intermetallic compounds. During preparation, spherical powders are typically produced using gas atomization, plasma rotating electrode (PREP), or plasma atomization techniques. These spherical powders exhibit excellent flowability, uniformity, and bulk density, making them ideal for powder metallurgy and additive manufacturing (AM). These materials combine high strength with high-temperature, corrosion, and wear resistance, making them suitable for applications in extreme environments.

United States market for High Entropy Alloy Spherical Powder is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
