High-Frequency Coagulation Devices, also known as Electrosurgical Units (ESUs), are medical instruments that utilize high-frequency alternating current to perform tissue coagulation (blood clotting) and hemostasis (stopping bleeding) during surgical procedures. These devices generate heat through the passage of electrical current through tissues, which causes protein denaturation and the subsequent formation of a blood clot. The basic principle of high-frequency coagulation involves the application of radiofrequency or microwave energy to the target tissue via a specialized electrode. The surgeon can control the intensity and duration of the energy delivered to achieve the desired effect, whether it's merely to seal small blood vessels or to coagulate larger areas of tissue.

The global High-frequency Coagulation Devices market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
