High-frequency coaxial cables are specialized cables designed to transmit electrical signals at high frequencies with minimal loss and interference. They consist of a central conductor, usually made of copper or aluminum, surrounded by an insulating material, known as dielectric, which is further encased in an outer conductor or shield. The shield prevents external electromagnetic interference from affecting the signal transmission and also helps contain the electromagnetic fields generated by the central conductor. They are widely used for transmitting high-frequency electrical signals, such as those used in telecommunications, cable television, internet connections, and networking applications.

The global High-frequency Coaxial Cables market size is projected to grow from US\$ 4917 million in 2024 to US\$ 7188 million in 2030; it is expected to grow at a CAGR of 6.5% from 2024 to 2030.
