## Abstracts

The global High Frequency Induction Furnace market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

High Frequency Induction Furnace is an electric furnace that uses high frequency current to generate an alternating magnetic field in an induction coil. This alternating magnetic field induces eddy currents in the metal billet or melt in the furnace, and the resistance heating effect generated by the eddy currents heats or melts the metal. High frequency induction furnaces are usually used to melt and heat small volumes of high resistance materials (such as steel, iron, copper, aluminum, etc.). Due to their fast heating speed, high efficiency and uniform heating, they are widely used in many industrial applications.

United States market for High Frequency Induction Furnace is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
