High-frequency SAW filters, full name high-frequency surface acoustic wave filters (Surface Acoustic Wave Filters), are electronic devices that use surface acoustic wave (SAW) technology to achieve signal filtering. SAW filters use the phenomenon of acoustic wave propagation on solid surfaces to achieve signal filtering and modulation, and have the advantages of high precision, low insertion loss, miniaturization and integration. SAW filters use the characteristics of piezoelectric crystals to generate and propagate surface acoustic waves on the surface of the crystal. Surface acoustic waves are elastic waves that propagate along the surface of an object, and their amplitude decreases rapidly as the depth of the substrate material increases. When the input signal enters the SAW filter, the surface acoustic wave will select a specific frequency for filtering based on the relationship between its propagation speed and wavelength. The signals of other frequencies are absorbed by the attenuation layer, thereby realizing the selection and filtering of the signal frequency band.

The global High Frequency SAW Filter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
