The global High Frequency UPS (Above 1KHZ) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

UPS, which uses a power frequency transformer as a rectifier and inverter component, is commonly known as a power frequency machine. Its main characteristics are stable and reliable main power components, strong overload capacity, and impact resistance. The industrial frequency machine is designed based on the principle of analog circuits. The power components inside the machine (such as transformers, inductors, capacitors, etc.) are mostly large power components. However, its control system and network communication all use mature, highly integrated and fast data processing chips, which are very accurate in data tracking and adjustment. This model has strong resistance to harsh power grid environmental conditions, and its reliability and stability are stronger than high-frequency machines. Power frequency UPS power supply is a long-standing power supply in the UPS industry, widely used in billing centers, communication base stations, bank branches, ATM machines, and network office environments in various industries such as securities, transportation, power, and industry.
