The research report highlights the growth potential of the global High Intensity Focused Ultrasound (HIFU) Therapy market. High Intensity Focused Ultrasound (HIFU) Therapy are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of High Intensity Focused Ultrasound (HIFU) Therapy. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the High Intensity Focused Ultrasound (HIFU) Therapy market.

High intensity focused ultrasound (HIFU) therapy kills cancer cells with high frequency sound waves. It can treat only a single tumor or a part of a large tumor and cannot be used to treat widespread tumors. Thus, the HIFU therapy is not suitable for the treatment of malignant tumor. This therapy is a novel, emergent and practices ultrasound waves that propagate through tissue media as energy carriers. HIFU therapy is a completely non-invasive technology that has great potential of tumor ablation, hemostasis, thrombolysis as well as targeted drug/gene delivery.

Rising prevalence of different types of cancers, especially, prostate cancer, kidney cancer, primary and secondary liver cancer, pancreatic cancer, and bladder cancer will boost growth of the market. According to the American Cancer Society, about 161,360 new cases of prostate cancer have been registered in the US in 2017.
