The global High Intensity Magnetic Filters market size is predicted to grow from US\$ 105 million in 2025 to US\$ 147 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

High intensity magnetic filters are filtration devices that utilize high-intensity magnetic fields to efficiently separate and remove ferromagnetic and weakly magnetic impurities from fluids, slurries, powders, or granular materials. This equipment uses high-performance permanent magnets (such as neodymium iron boron magnets) or electromagnetic systems to create a high-gradient, high-intensity magnetic field in the filtration area. This causes iron filings, abrasive particles, iron oxide, fine metal powders, and other magnetic contaminants in the material to be adsorbed onto the surface of the magnetic elements, thereby achieving media purification, equipment protection, and product quality improvement.

The upstream of the industry chain mainly includes suppliers of NdFeB permanent magnet materials, electromagnetic coils, stainless steel housings, magnetic rod assemblies, control systems, sensors, and processing equipment. High-performance rare-earth permanent magnet materials and magnetic circuit design are the core factors determining magnetic field strength and filtration efficiency. The midstream is the manufacturing segment of high strength magnetic filters, encompassing magnetic circuit design, magnetic component manufacturing, filtration system integration, automatic cleaning system development, and equipment assembly. It mainly produces products such as pipeline magnetic filters, automatic cleaning magnetic filters, high-gradient magnetic filters (HGMS), and electromagnetic filtration systems. The downstream is widely used in industries such as lithium battery positive and negative electrode materials, electronic ceramics, semiconductor materials, food and beverage,

pharmaceuticals, chemicals, mining, water treatment, metalworking fluids, and new energy materials.

In 2025, global sales of high strength magnetic filters reached 170,500 units, with a production capacity of approximately 243,500 units. The average selling price was US\$628 per unit, and the average gross profit margin was 30%-40%.

The development of the global new energy industry, high-end manufacturing, and green industry has provided a favorable policy environment for the high-strength magnetic filter market. Various countries are promoting the development of new energy vehicles, energy storage batteries, semiconductors, and advanced materials industries, driving increased investment in high-purity production equipment. China's continued efforts to advance the construction of the new energy industry chain and the localization of key materials are boosting demand for iron removal equipment for lithium battery materials. Meanwhile, increasingly stringent food safety regulations, pharmaceutical GMP standards, and environmental requirements are also driving companies to increase investment in high-performance magnetic filtration equipment.
