A High Intensity Obstruction Marking Light is a specialized lighting system designed to warn aircraft of tall structures that could pose a collision risk, ensuring safe air navigation. These lights emit bright, powerful beams, often in flashing white, and are regulated by standards such as those set by the FAA and ICAO, which specify intensity, flash frequency, and operational modes (day, twilight, night). They are typically installed on structures exceeding 150 meters in height, including skyscrapers, communication towers, wind turbines, bridge pylons, and airport infrastructure. High intensity models are crucial for visibility in various weather conditions and at long distances, with some featuring intelligent controls to adjust brightness based on ambient light. Their primary function is to mitigate aviation hazards by clearly marking obstructions, thereby reducing the risk of mid-air collisions and enhancing overall airspace safety.
