The thermal shock test box is a necessary test equipment for the metal, plastic, rubber, electronic and other material industries. It is used to test the material structure or composite material. It can withstand the extreme high temperature and low temperature in an instant. To detect the chemical changes or physical damage caused by thermal expansion and contraction of the sample in the shortest time, the high and low temperature impact test chamber is divided into three-box type and two-box type according to test requirements and test standards. The difference lies in the test method and internal structure. The three-box type is divided into a cold storage room, a heat

storage room and a test room. The product is placed in the test room during testing. The two-box type is divided into a high-temperature room and a low-temperature room. The motor drives the basket to switch between high and low temperatures. The product is placed in the basket and moves with the basket.
