The global High-performance Magnetorheological(MR) Fluid market size is predicted to grow from US\$ 3596 million in 2025 to US\$ 13950 million in 2032; it is expected to grow at a CAGR of 21.8% from 2026 to 2032.

Magnetorheological fluid is an intelligent fluid material that can control rheological properties (such as kinematic viscosity, shear stress between liquids, yield strength of solid-liquid transition, plastic modulus of liquids and so on) by adjust the magnitude of the magnetic field. It is a solid-liquid two-phase suspension composed of base fluid and magnetizable particles. Under the action of an external magnetic field, it can instantly change from a fluid with good fluidity to a viscoelastic solid, the yield stress can reach 50-100kPa, and the apparent viscosity can be increased by 100,000-1,000,000 times. When the magnetic field is removed, the magnetorheological fluid can be transformed from its original viscoelastic solid to a fluid state again. Therefore, the viscosity (fluidity) of the fluid can be regulated by the magnitude of the surrounding magnetic field. Magnetorheological fluids have the advantages of low conversion energy consumption, easy control, and fast response time (millisecond response), which have broad application prospects in many fields such as aviation, precision polishing, automotive and civil engineering.
