The global High Performance Quadruped Robot market size is predicted to grow from US\$ 2404 million in 2025 to US\$ 4410 million in 2032; it is expected to grow at a CAGR of 9.2% from 2026 to 2032.

A high-performance quadruped robot is a four-legged bionic robot with the ability to move at high speed, carry a large payload, and adapt to complex terrain. It is often used in high-intensity mission scenarios such as industrial inspection, security patrol, rescue, scientific research, and military. Global sales in 2024 will be approximately 28,000 units, with an average unit price of approximately US\$82,000 in 2024 and a single-line production capacity of approximately 600 units. Upstream companies are mainly suppliers of servo motors, power electronics, embedded controllers, sensors (lidar, IMU, etc.) and structural materials. Downstream companies are mainly defense departments, security companies, industrial automation manufacturers, scientific research institutions, and large-scale engineering project contractors.

High-performance quadruped robots are moving from 'showing off' to 'making money'. The domestic supply chain has cut the joint costs by half compared to overseas. Yushu and Yunshenshen have won 70% of global shipments by virtue of low prices and fast iterations. Consumer-grade educational products are sold at a price of tens of thousands of yuan, while industrial-grade products rely on IP66 dust and water resistance, 35° climbing and 100 kg load to cut into power inspection, offshore platforms, and emergency rescue. The price of one unit can reach hundreds of thousands of yuan, truly solving the pain point of 'machine replacement' in dangerous scenes. According to IDC statistics, about 20,000 units will be shipped worldwide in 2024, with China accounting for 70%. It is expected that sales will double again in 2025. The policy side has clearly given hard indicators for robot replacement rates in mining

and firefighting, coupled with domestic laser radar. The price of planetary reducers continues to fall, and the BOM cost of the whole machine still has room to fall by 30%. The industry is shifting from 'selling hardware' to 'selling services'. Leading manufacturers have launched desktop-level AI training platforms, opening motion control algorithms to integrators, and charging subscription fees based on inspection mileage or rescue times, forming a consumable cash flow; embodied intelligence and large models allow quadruped robots to learn to independently plan gaits, identify equipment defects and generate reports, and the proportion of software value is rapidly increasing. In the next three years, whoever can be the first to connect 'low-cost entity + industry AI package + operation and maintenance sharing' will be able to obtain high-stickiness orders in the price red ocean and lock in the compound dividends of the next round of AI computing power and energy inspections.
