High-performance servo drive system is a feedback control system used to accurately follow or reproduce a certain process. The servo system is an automatic control system that enables the output controlled quantity of the object's position, orientation, state, etc. to follow any change of the input target (or given value). Its main task is to amplify, transform and regulate the power according to the requirements of the control command, so that the output torque, speed and position control of the drive device are very flexible and convenient. In many cases, a servo system refers specifically to a feedback control system in which the controlled quantity (the output of the system) is mechanical displacement or displacement velocity and acceleration, and its function is to make the output mechanical displacement (or rotation angle) accurately track the input displacement ( or corners), its structural composition is not fundamentally different from other forms of feedback control systems. The servo system was originally used in national defense and military industry, such as the control of artillery, the automatic driving of ships and aircraft, and the launch of missiles. Later, it was gradually extended to many sectors of the national economy, such as automatic machine tools, wireless tracking control, etc.
