The high-precision base editing system is a gene editing technology that can achieve precise replacement or modification of a single base pair in a DNA sequence without cutting double-stranded DNA. The system mainly includes C-base editors and A-base editors, which are used to replace cytosine (C) with thymine (T) and adenine (A) with guanine (G), respectively. The high-precision base editing system has a high editing accuracy and low off-target effect, and is widely used in gene therapy, genetic research, agricultural biotechnology and other fields.

The global High-Precision Base Editing System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
