The global High Precision Electrohydrodynamic Jet Printing System market size is predicted to grow from US$ 48.2 million in 2025 to US$ 129 million in 2031; it is expected to grow at a CAGR of 17.8% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Electrohydrodynamic jet printing (EHDJET), also known as Electrostatic jet printing (ESJET), or super inkjet (SIJ), is an emerging new technology for printing very high resolution, high aspect ratio structures. Here, droplets or continuous jets are ejected by applied electric fields instead of mechanical actuation. Exposure to an electric field causes mobile ions in a polarizable liquid to accumulate at the liquid surface. The coulombic repulsion of the ions causes the meniscus at the nozzle end to deform into a conical shape, called a Taylor cone. When the electric field exceeds a critical limit, the stress from the surface charge repulsion at the cone apex exceeds the surface tension and a droplet of fluid is emitted towards the grounded substrate, achieving pattern printing.The high-precision electrohydrodynamic inkjet printing system studied in this report refers to an electrohydrodynamic inkjet printing system with a positioning accuracy of less than or equal to 3 microns and a repeat positioning accuracy of less than or equal to 1 micron, mainly desktop (vertical) type.

United States market for High Precision Electrohydrodynamic Jet Printing System is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
