The global High-Precision Indoor Positioning Chip market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A high-precision indoor positioning chip is a microelectronic chip specifically designed to achieve precise positioning in indoor environments, usually in combination with ultra-wideband (UWB), Bluetooth, Wi-Fi or other positioning technologies. It can track the position of objects or people in real time in complex indoor spaces, with an error range usually at the centimeter level, and is widely used in smart homes, industrial automation, warehouse management, medical care and other fields. The chip improves the efficiency and accuracy of indoor navigation, asset tracking and security management through its high-precision positioning capabilities.

The popularity of high-precision indoor positioning chips will greatly change the positioning and management methods of modern indoor scenes. Compared with traditional positioning technology, it can not only achieve centimeter-level precise positioning, but also maintain stability and reliability in complex signal environments. The widespread application of this chip will promote the automation and intelligent development of smart homes, Industry 4.0, medical monitoring, warehousing and logistics, and provide more efficient solutions for asset management, personnel positioning, navigation guidance, etc. With the continuous expansion of the Internet of Things, high-precision indoor positioning chips will become an important infrastructure for optimizing indoor space management.
