The global High-Precision NDIR Gas Sensor market size is predicted to grow from US$ 843 million in 2025 to US$ 1536 million in 2032; it is expected to grow at a CAGR of 9.1% from 2026 to 2032.

NDIR gas sensors use the infrared absorption properties of gas molecules (e.g., CO2) to calculate their concentration. Therefore, the NDIR gas sensor is equipped with an infrared light source that emits infrared rays and an infrared sensor that detects infrared rays. The infrared light is directed at the gas in the measuring tube and part of the light is absorbed by the gas molecules to be measured. Subsequently, the rest of the infrared light hits the filter and reaches the infrared detector. Ideally, only the gas to be measured absorbs light of the corresponding wavelength. However, since the gas mixture contains a variety of gases, the absorption regions may overlap, thus enhancing cross sensitivity. The interference part must either be tested for compensation (to avoid false measurements) or avoided by clever selection of spectral ranges. With the NDIR sensor, more than 100 different gases can be detected from ppm to percentage. In many applications, this is the preferred method because the measurement method is non-contact and non-consuming.

The safety of workers is of prime importance in every industry. Workers in the mining, medical, industrial & manufacturing,chemicals, fertilizers, and oil & gas industries are exposed to extremely hazardous environments. Toxic gases such ascarbon dioxide, carbon monoxide, hydrocarbons, and sulfur hexafluoride are generated during various extraction andrefining processes in the oil & gas and chemical industries. If inhaled in excess, these gases can have severe effects onhuman health, even leading to death in extreme cases.High concentrations of harmful and combustible gases in theworkplace environment can even cause explosions or fire accidents.
