The global High Pressure Carbon Dioxide Fire Extinguishing System market size is predicted to grow from US\$ 672 million in 2025 to US\$ 812 million in 2031; it is expected to grow at a CAGR of 3.2% from 2025 to 2031.

Carbon dioxide is canned and stored after being liquefied under high pressure. When it is sprayed, the volume expands rapidly and absorbs a lot of heat, which can reduce the temperature of the fire scene, and at the same time dilute the oxygen concentration in the protected space to achieve the effect of suffocating and extinguishing.

The high-pressure carbon dioxide (CO₂) fire extinguishing system is a system specially used for fire extinguishing, which uses high-pressure compressed CO₂ gas as the fire extinguishing medium. It is widely used in places that require rapid fire extinguishing and no residue, such as electrical equipment rooms, machine rooms, warehouses and ship cabins. The working principle of the high-pressure carbon dioxide fire extinguishing system is to store CO₂ gas in a high-pressure container. When a fire occurs, it releases CO₂ gas to form a high concentration, and quickly reduces the oxygen concentration to a level that is not enough to support combustion, thereby suffocating the flame. CO₂ gas also has a cooling effect and can suppress a fire by absorbing heat.
