High-Pressure Die Casting (HPDC) is a versatile manufacturing method for producing various product forms. The process forces molten metal at high speed and high pressure into a closed steel die cavity. The die is mounted to the die casting machine's platens with its stationary and moving halves. With its injection end using hydraulics and pressurized gas to move a piston forward, the die casting machine injects the molten metal into the closed steel die. Utilizing hydraulics and mechanical toggles, the clamping end absorbs the injection pressure and holds the die shut while the part solidifies. The process can turn molten metal into a solid near-net-shape part in seconds, showcasing its versatility in various applications. HPDC Mould Tools refers to the mold system used to form metal parts in high-pressure die casting machines. It is usually made of high-strength steel (such as H13, SKD61) and consists of multiple interfitting components that can withstand extreme high temperatures and pressures in a short period of time.
