High-pressure water jet deburring technology is a flexible processing technology that uses the powerful cutting force of high-pressure water jets to remove burrs.

Experiments have shown that this process has the advantages of stable deburring ability, high production efficiency, and easy automation.

The High-Pressure Water Jet Deburring System is used to effectively remove burrs and flush away unwanted burrs, chips and debris from narrow cavities, internal intersections, threads and component edges of complex machined parts. The pressure accelerates the water to supersonic speeds, and when the water hits the part, it shears, pushes and erodes away burrs and removes debris in its path without damaging the surface finish or radius edges. This method is environmentally safe and does not use potentially damaging abrasives or solvents. Depending on the geometry of the part, a combination of specialized fixed and rotating nozzles are used to direct high-velocity water jets to specific areas of the workpiece or to the entire surface.

The global High-Pressure Water Jet Deburring System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
