## Abstracts

The global High Purity Electrolytic Iron Flake market size is predicted to grow from US\$ 25.21 million in 2025 to US\$ 29.68 million in 2032; it is expected to grow at a CAGR of 2.7% from 2026 to 2032.

In 2025, global High Purity Electrolytic Iron Flake reached approximately 3,220.8 tons, with an average global market price of around 8.0 USD/kg.

High Purity Electrolytic Iron Flake refers to a flaky metallic iron product with extremely high purity (typically no less than 99.98%, and up to 99.99% or above) prepared through advanced electrolytic deposition and multi-stage purification processes. It is produced by dissolving raw iron materials in an acidic electrolyte, then depositing pure iron crystals on the cathode under controlled electrical current conditions, followed by post-processing into thin flake shapes. Characterized by ultra-low impurity content of carbon, oxygen, sulfur and other harmful elements, uniform flake structure, near-zero surface oxidation and excellent magnetic uniformity, it is a critical high-performance material for applications where even trace contaminants can significantly affect product performance.

Demand for High Purity Electrolytic Iron Flake is mainly driven by the upgrading of high-end manufacturing industries, focusing on sectors that require superior material purity and stable performance, such as electronics & semiconductors, aerospace & defense, energy and additive manufacturing. Business opportunities lie in the expanding application of advanced functional materials, the growing demand for customized flake specifications (including thickness, size and surface treatment) to meet diverse scenario needs, the promotion of low-carbon production policies that favor eco-friendly electrolytic processes, and the increasing focus on localized supply in emerging high-

tech industries, which collectively provide favorable conditions for market expansion and technological optimization of related products.
